Education

California Polytechnic State University, San Luis Obispo

Sept 2021 - June 2025

B.S. Computer Science - Data Engineering Concentration

GPA: 3.732

Technical Skills

- Languages: Python, Java, C#, JavaScript, TypeScript, Golang, SQL, HTML, CSS
- Technologies: Git, Docker, Kubernetes, MySQL, Pandas, NumPy, Node.js, React, Express, D3.js, RESTful APIs
- ML/AI: PyTorch, scikit-learn, Retrieval Augmented Generation (RAG), Neural Networks, Convolutional Neural Networks, Recurrent Neural Networks, Transformer Models, Large Language Models (LLMs)

Work Experience

Tax Relief Advocates

October 2025 - Present

Junior AI Engineer | Python, TypeScript | Predictive Modeling

Irvine, CA

- Developed **Python**-based data extraction pipelines to parse IRS Record of Account and 1040 Tax Return forms, streamlining data collection and supporting accurate tax resolution strategies for clients
- Engineered a high-precision IRS debt engine capable of calculating **CSED (Collection Statute Expiration Dates)** by implementing **pre-indexing of tolling rules** and dictionary-based transaction pairing, resulting in accurate multi-year debt modeling and potential savings across various payment plans
- Architected a data transformation layer to support **Agentic AI workflows**, enabling AI agents to autonomously navigate consolidated ledgers and execute complex transaction-to-debt assignments
- Managed the end-to-end development lifecycle, from creating **Jira** tickets with clear technical specifications to conducting **code reviews** to eliminate bugs, code smells (**SonarQube**), and security vulnerabilities (**BurpSuite**)

Infios

June 2025 - August 2025

Software Engineering Intern | Python | Large Language Models

Remote

- Designed a **Retrieval-Augmented Generation (RAG) system** leveraging **OpenAI GPT** models to automate internal technical support, enabling intelligent query-to-content matching and reducing documentation lookup time
- **Developed a hierarchical Markdown parser** that preserves document structure (parent-child relationships) through header-level chunking, improving contextual relevance during retrieval
- Containerized and orchestrated the application using **Docker** and **Kubernetes**, managing deployments via **Helm charts** on **Oracle Cloud Infrastructure (OCI)**

Related Experience

League of Legends Esport Statistics Visualizer

Jan 2025 - June 2025

Fullstack & Deep Learning | Python, SQL, TypeScript | Data Analytics

Cal Poly SLO

- Architected a **full-stack** analytics platform using **React**, **Node.js**, and **TypeScript** to visualize 11 years (2014–2025) of global esports data, featuring a **RESTful API** and a scalable **MySQL** database with 36,000+ match records
- Engineered an **ETL pipeline in Python (Pandas)** to ingest and normalize disparate data sources, including Oracle's Elixir CSVs and Riot Games' Data Dragon API, ensuring 100% data integrity across tournaments and champions
- Developed a hybrid **Deep Learning** pipeline using **PyTorch**, combining an **LSTM RNN** (7-layer) to model team momentum with a **Neural Network** for match outcome prediction, achieving a 98% training accuracy

Solving Where's Waldo with Spatial Partitioning

May 2025 - June 2025

Distributed Computing | Python, GoLang

Cal Poly SLO

- Designed a **fault-tolerant distributed system** in **Go** using a **Leader-Worker** architecture and **Gossip heartbeat protocol** to ensure 99.9% availability and autonomous failure recovery across compute nodes
- Fine-tuned a **Vision Transformer (ViT-B/16)** using **PyTorch** and transfer learning; implemented class weight balancing and data augmentation to achieve **98.9% accuracy and 99.4% recall**
- **Conducted rigorous scalability analysis**, identifying an optimal performance at 8 nodes and documenting network fan-out bottlenecks and false-failure detection overhead at higher scales (12+ nodes)
